

Export As HTML Table v1.5.1

AppleScript for iTunes

Find more **free** AppleScripts
and info on writing your own
at Doug's AppleScripts for iTunes.

This script exports the contents of the selected playlist (or just the selected tracks in a playlist) to a HTML document which the script custom-builds based on the track information you choose to include.

This script is Donationware. If you use it and like it *please* consider making a donation to support my AppleScripting efforts. [Click here for more info.](#)

Installation:

If you installed the files from the downloaded disk image by dragging them to the "Installer", then the AppleScript and this Read Me document have already been installed in your *[user name] > Library > iTunes > Scripts* folder. The script will appear in iTunes' Script menu, where you can activate it by clicking on its name.

To manually install, if necessary: Put AppleScripts in your iTunes Scripts folder. This is located in *[user name] > Library > iTunes*. If there is no folder named "Scripts" there, create one and put the script(s) in it. AppleScripts will then appear in iTunes' Script menu, and can be activated by selecting by name and clicking. Be sure to also save this Read Me document in a safe and convenient place.

How to use:

Simply select a playlist in the iTunes Source pane, or select some tracks, and run the script.

Customizing:

It is not difficult to change some of the HTML values in "Export as HTML Table", even if you are not familiar with AppleScripting.

Open the AppleScript "Export as HTML Table" in Script Editor by double-clicking the script, or use Script Editor's **File > Open** menu. Work on a copy or save a back-up just in case.

Near to the top of the script you will see several "properties", shown below. If you know HTML you will probably recognize some of these values (the following may render somewhat differently in Script Editor at your house):

```
-- initial HTML options
property myBackgroundColor : "white" -- background color, can also use "#ffffff", etc
property myTextColor : "black" -- text color, can also use "#000000", etc
```

```

-- table attributes
property mycellpadding : "1" -- padding inside cells
property mycellspacing : "0" -- padding outside between cells
property myborder : "1" -- thickness of table border, 0 is no border

-- Title line attributes
property myTitleJustification : "center" -- (align left, center, or right) justification in main title cell

-- TH attributes
property myTHJustification : "left" -- (align left, center, or right) justification in column headers

-- TD attributes
property myTDJustification : "left" -- (align left, center, or right) justification in data cells

-- face & size
-- size can be relative (-1,-2,+1,+2, etcetera) or 1,2,3,4,5 -- smaller IS better!
-- font can be set to any installed font

-- top line where name of playlist, number of songs, time, and length appear
property myTitleFont : "Geneva" -- font for title line
property myTitlesize : "-2" -- font size for title line

-- column headers
property myTHFont : "Geneva" -- font for headers
property myTHsize : "-2" -- font size for headers

-- text in cells
property myTDFont : "Geneva" -- font for data
property myTDsize : "-2" -- font size for data

```

You can change the values on the right side of the ":" in the script to values that are more to your liking. If you do decide to change anything, make sure that you maintain the quotation marks.

After making changes, "Save" the script.
