

# Scour Web Page for Media

v0.5

## AppleScript for iTunes

Find more **free** AppleScripts and info on writing your own at Doug's AppleScripts for iTunes.

This script will examine the current web page in **Safari** for your choice of media files (mp3, aac, and pdf) and allow you to select any found files to download and then add to iTunes.

**DISCLAIMER:** this script is not intended to be used to download copyrighted material. Please bear that in mind.

**This script is Donationware. If you use it and like it *please* consider making a donation to support my AppleScripting efforts. [Click here for more info.](#)**

### Installation:

If you installed the files from the downloaded disk image by dragging them to the "Installer", then the AppleScript and this Read Me document have already been installed in your *[user name] > Library > iTunes > Scripts* folder. The script will appear in iTunes' Script menu, where you can activate it by clicking on its name.

**To manually install, if necessary:** Put AppleScripts in your iTunes Scripts folder. This is located in *[user name] > Library > iTunes*. If there is no folder named "Scripts" there, create one and put the script(s) in it. AppleScripts will then appear in iTunes' Script menu, and can be activated by selecting by name and clicking. Be sure to also save this Read Me document in a safe and convenient place.

Alternatively, you can install the script in *[username]/Library/Scripts/Safari/* to make it accessible in the system-wide Scripts Menu, and thus, accessible from Safari.

### How to use:

Load a page in Safari that you believe contains links to media files (for instance, a MP3 blog site).

Run the script. You will be asked to select **one** file type to search the web page for:

After a few moments, if files of the selected file type are found on the web page, you will see a choose box listing the found files.

Select the files from the choose box you want to download and click "OK".

Next, a choose folder box will ask you to select a location to download the files to. The default location is your Desktop.

The next dialog box will ask if you want to add the files to iTunes, if you want to add them to a particular playlist, and if you want to delete the original files after adding them to iTunes. (In the latter case, you may want to do this if your iTunes Preferences are set to "Copy files to iTunes Music folder when adding to library" to prevent having two copies of the file.)

In a few moments, each selected file will be downloaded and added to iTunes, if that is what you opted to do.

The script will notify you when the entire operation is complete.

#### Notes:

The script *tries* to do a good job locating valid media links in the selected Safari web page. I tested

it on several pages but obviously I can't account for all pages and all link variations. I would like to hear from you if you have problems with a particular page. In that regard, error messages are numbered so it can be determined where things may have gone wrong in the script.

I would like to include video files in a future version, but these can be tricky when included on a web page.
